

Subject Description Form

Subject Code	BRE204
Subject Title	Structure I
Credit Value	3
Level	2
Pre-requisite / Co-requisite/ Exclusion	Nil
Objectives	<ul style="list-style-type: none"> a) Encourage an appreciation of the structure of buildings. b) Develop concepts of structural action, leading to an ability to model, analyse and design common elements and structural frames, by understanding simple structural framing.
Intended Learning Outcomes	<p>Upon completion of the subject, students will be able to:</p> <ul style="list-style-type: none"> a) Use mathematical modelling to explain the behaviour of building materials and structures. b) Apply the concepts of structural mechanics to solve structural problems involving beams, columns and statically determinate frames. c) Quantify and analyse the internal and external forces (i.e. internal moments/stresses and external loads) acting within and upon a structural component under various anticipated loading conditions. d) Design simple structural elements to withstand these forces in their respective loading conditions.
Subject Synopsis/ Indicative Syllabus	<p><i>Identification of forces and their effects on structures:</i> Point and distributed static loading, (quasi-static) wind loading, load transfer in common building structures of various forms.</p> <p>Reaction of structural materials to imposed loads (with induced stresses and deformation).</p> <p><i>Statically determinate truss:</i> Computation of internal forces using the Method of Joints and Method of Section.</p> <p><i>Stresses:</i> The induced stresses as a combination of tension, compression, flexural bending moment and shear.</p> <p><i>Beams:</i> Simple flexural theory, computation of bending stresses, shearing force and bending moment distribution, deformation and deflection of beams, sizing of simple steel beams to current codes.</p> <p><i>Columns and walls:</i> Simple buckling theory of columns, effective length and slenderness ratio in relation to fixity conditions, combined stresses as subjected to eccentric axial load, sizing of steel columns to current Hong Kong Standard.</p>
Teaching/Learning Methodology	<p><u>Interactive Lectures</u> will enable students to:</p> <ul style="list-style-type: none"> 1. analyse the internal forces of truss members, beams and columns; 2. analyse the strength of the materials for axial, bending and shear loadings. 3. apply the structural concept to design simple beams, columns and connections.

	<p><u>Tutorial</u> will enable students to:</p> <ol style="list-style-type: none"> consolidate the structural mechanics and analysis concepts through problem-solving assignments and discussions. <p><u>Laboratory</u> will enable students to:</p> <ol style="list-style-type: none"> identify the structural behaviour of simple truss, beams, and columns. 																																												
<p>Assessment Methods in Alignment with Intended Learning Outcomes</p>	<table border="1" data-bbox="440 495 1474 1032"> <thead> <tr> <th rowspan="2">Specific assessment methods/tasks</th> <th rowspan="2">% weighting</th> <th colspan="4">Intended subject learning outcomes to be assessed (Please tick as appropriate)</th> </tr> <tr> <th>a</th> <th>b</th> <th>c</th> <th>d</th> </tr> </thead> <tbody> <tr> <td>1.
